Description

A third-year computer science student with experience in full-stack development, serverless platforms, and the Next.js framework. I am looking for opportunities to apply my knowledge of AI integration and performance optimization for a suitable position.

Education

Lamrin Tech Skills University (2024 - 2028)

B.Tech in Computer Science Engineering

CGPA: 9.61 (2nd year)

Skills

Languages: Typescript, Golang, C++, Python, Java

Frameworks and UI Libraries: Next.js, TailwindCSS, Hono, ShadCN, Daisy UI

Databases/Backend: Supabase, Rest APIs, Convex DB, Clerk

Tools/Devops: Git/Github/Codeberg, Vercel, Cloudflare Workers, Netlify, Bun

Key Projects

Rapid Chat | *AI Aggregation Platform* - [Hosted on Vercel](#) | [Github](#)

Designed a robust, high-performance chat platform with **dynamic model control via Convex**, enabling real-time switching models while maintaining a zero-tracking privacy policy.

Technologies Used: Next.js, Convex, AI SDKs (OpenAI, Groq)

GoodProxy | *High-Performance Serverless Proxy* - [Hosted on Cloudflare Workers](#) | [Github](#)

Developed a **low-latency, serverless proxy** specifically optimized for high-throughput media handling (HLS streams, VTT files) and engineered to bypass complex browser CORS restrictions efficiently.

Technologies Used: Hono, Bun

Immortal Agent | *General Purpose Agent* - [Github](#)

Local-first, agentic CLI assistant with tool use + long-term memory, telegram integration and TTS+STT support, Aggressive prompt caching reduces cost (13 million tokens processed under 0.2\$)

Technologies Used: Golang, Gemini SDK

Dictate | *Alternative to WhisperFlow* - [Github](#)

A voice dictation application written in Go. It enables system-wide voice-to-text input by listening to your microphone, transcribing your speech using Groq's Whisper API, copying it to your clipboard, and automatically pasting it into the active text field.

Technologies Used: Golang, Groq API

Concurrent Weather Dashboard | *High-Performance Weather Aggregator* - [Github](#)

Engineered a concurrent weather aggregator in Go that fetches live data for 101 cities in under 2 seconds using a 70-goroutine worker pool, broadcasts real-time updates to all connected clients via SSE, and serves from an in-memory cache to eliminate redundant API calls.

Technologies Used: Golang, OpenWeatherMap API

Open Source Contribution

Dramalama (100+ GitHub Stars) - [Github](#) | [Live Deployment](#)

Full-stack media consumption tracker built on Next.js, utilizing the TMDB API, and styled using Tailwind CSS/Daisy UI. Recognized by the community with 36 forks. *Update: Got DMCA'd*

Good Proxy (23 Stars) - [Github](#)

High-performance proxy architecture developed to handle severe load spikes, routing over **100,000 requests per deployed instance** (2 instances total). The utility led to 28 forks.
